

BlueSeries eXpress'it...

... can distribute your data via fax, e-mail or FTP directly from all AS/400 and iSeries systems within the company

The BlueSeries eXpress'it package makes it easy to send and receive fax directly on your iSeries

You can email all types of data – e.g. an order confirmation in PDF format or an invoice in XML format

The BlueSeries package is easy to install and is implemented without any changes to your existing systems.

It is an economical solution!

Send invoices, account statements and order confirmations in the format you prefer. With eXpress'it you can email with PDF or XML format or you can use the traditional fax format. Sending documents is done by pushing one button - save time and postage, paper and envelopes.

Send your fax directly from the individual workstations, without having to make a cover page - and no more waiting by the fax machine.

From this view it is possible to resend a transmission or even send it to a new receiver. Also it is possible to revise an entry that has not yet been sent.

User-friendly

Any user can take immediate advantage of the system; sending a document is just as easy as printing a list, and the fax or email can be sent to one or more recipients in one process.

Receive your personal faxes directly on your screen, on the nearest printer or as e-mail

Both incoming and outgoing faxes can be displayed graphically on the screen via the provided PC-Client to Windows. The fax can also be printed on the nearest laser printer or routed to the individual employees e-mail mailbox.

The PC-Client integrates Windows

The provided PC client makes it possible to send faxes and e-mails from all programs under Windows using a shared address book. The language on the PC-client can be set up individually per user, using the available languages within eXpress'it.

Easy integration to ERP-solutions

The "Spooled File Expert" can translate spool files from all ERP-solutions and send them as fax or e-mail. If the spool file contains fax or e-mail to several receivers, it will automatically be split up and send separately. If information regarding fax number or e-mail address is missing, this will be derived from the ERP-systems database e.g. via customer number.

A specific cover page, fax overlay, sending priority and timed sending is an example of information that is controlled individually per receiver.

Individual fax cover pages

Create a catalogue with individual cover pages, to reflect the organization needs. When sending a fax, the cover page is automatically created with graphic elements, fixed text and specific information relating to the fax in question.

BlueSeries is delivered with the common fonts Courier, CG Times, and Arial. The tool - FontWizard - running under Windows will copy True type fonts directly from the PC environment to BlueSeries - ready to use on fax cover pages.

Complete overview of all BlueSeries transmissions

One log provides complete overview of all incoming and outgoing faxes as well as e-mail and FTP transmissions.

It is easy to see when a fax was sent or received and who the sender and receiver were. Further the log will show whether an email is read by the recipient.

Keep your Cost Low

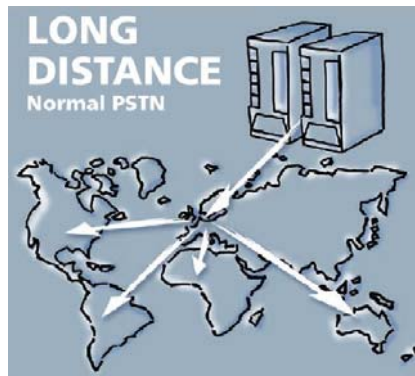

Sales Department:
"All customers registered with a fax number will automatically get their order confirmation directly on fax."

Accounting:
"One push on a button and an invoice copy is sent from the archive to the customer."

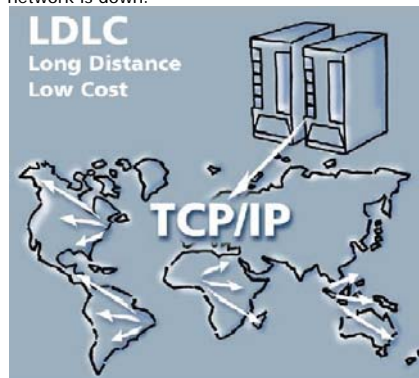

Administration:
"The XML interface has dramatically improved our customer service."

The Long Distance Low Cost-feature gives you even more advantages

The BlueSeries Fax can send faxes through fax modems placed in the existing TCP/IP- network, which means that a department abroad can send faxes at local rate - Long Distance Low Cost (LDLC).

The connection is established with a TCP/IP line connected to the existing network. With this set-up any locally placed fax modem e.g. in a sales office in Germany can be used to send faxes at local rate, even if the AS/400 and iSeries system is placed in England. If you send a fair amount of faxes abroad, this feature can save you a lot of money. Different series of fax numbers is attached to a "Modem Pool" this way the system can differentiate between e.g. German and English receivers and send the fax via the correct modem in the right country. A Fallback feature ensures that important faxes can be send via an alternative line if the local network is down.

Easy to add graphics, logo and signatures

BlueSeries will handle graphics such as logos and signatures with variable or a fixed placement.

BlueSeries can at all time be combined with various forms products making it possible to either fax or email these forms.

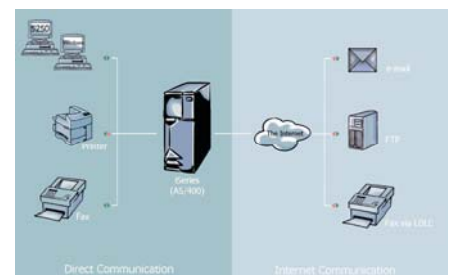

BlueSeries fully supports the print formats AFP, AFPDS, IPDS PCL and Postscript This option gives you a hassle free conversion from products using these formats.

Support for PDF format

When using e-mail BlueSeries will ensure the original look on any AS/400 and iSeries print by sending them as attached graphic files. Choose between TIFF and the popular PDF-format either per receiver or on system level.

XML

Included in the eXpress'it package you will also find. BlueSeries XML. This is a tool for generating XML files. Spool files can be converted into XML, and XML files can be converted into Spool files. Other files and format structures are supported as well.

BlueSeries eXpress'it

The BlueSeries eXpress'it package consists of the following modules:

- BlueSeries Base
- BlueSeries Fax
- BlueSeries Mail/FTP
- BlueSeries XML
- 10 BlueSeries PC-Clients

The BlueSeries product line ...

BlueSeries is the optimal solution when you want to distribute your iSeries (AS/400) spool print as e-mail, fax or XML documents.

Fax
Send/Receive Fax .

IceBreak
IceBreak enables you to build web applications on the IBM iSeries (AS/400) server platform and to reuse your RPG coding skills and legacy code.

Mail/FTP
Send/Receive email from BlueSeries. All types of data can be sent as attachments.

SMS
SMS Communicator integrates SMS to the company communication flow. SMS Monitor enables you to monitor every movement and process on your iSeries.

PC-Client
Collecting and organizing electronic documents in any format.

XML
All types of Spooled data can be converted into XML format. Inbound XML can be converted into a spooled file.
