

InterFax

...Let the fax replace your printer

*Structure the print-out
and send it
automatically*

InterFax is a Danish Designed software program for iSeries (IBM AS/400) that enables you to distribute InterForm generated documents via Facsimile. No special hardware is needed for the iSeries.

The InterFax module secures a uniform and correct translation of InterForm output to Fax format, using a minimum of overhead.

InterFax is fast - it can be integrated without changes to your existing systems – it works direct on the internal modem on your iSeries or with an external modem.

All you need to do to start sending faxes is load the software, attach the modem to the system if modem required and plug in the phone line. Typical installation time is less than 20 minutes.

User-friendly

Any user can take immediate advantage of the system, sending a fax is as easy as printing a list, and the fax can be send to one or several receivers in one process.

The InterFax module works in the back-ground like InterForm. A user distributing a document will be informed automatically if the distribution fails. Also the log system is available for the users to establish the status of their document distribution.

Incoming faxes can either be printed or they can be routed to any user on the system. Further they can also be displayed using the PC client.

Integration with InterForm

The InterFax software is mainly a conversion and distribution tool for InterForm. In InterForm the faxing definitions are made like the e-mail "finishing-definitions". Once these definitions are made, you are ready to distribute your business documents via fax in the same manner as when e-mailing from InterForm.

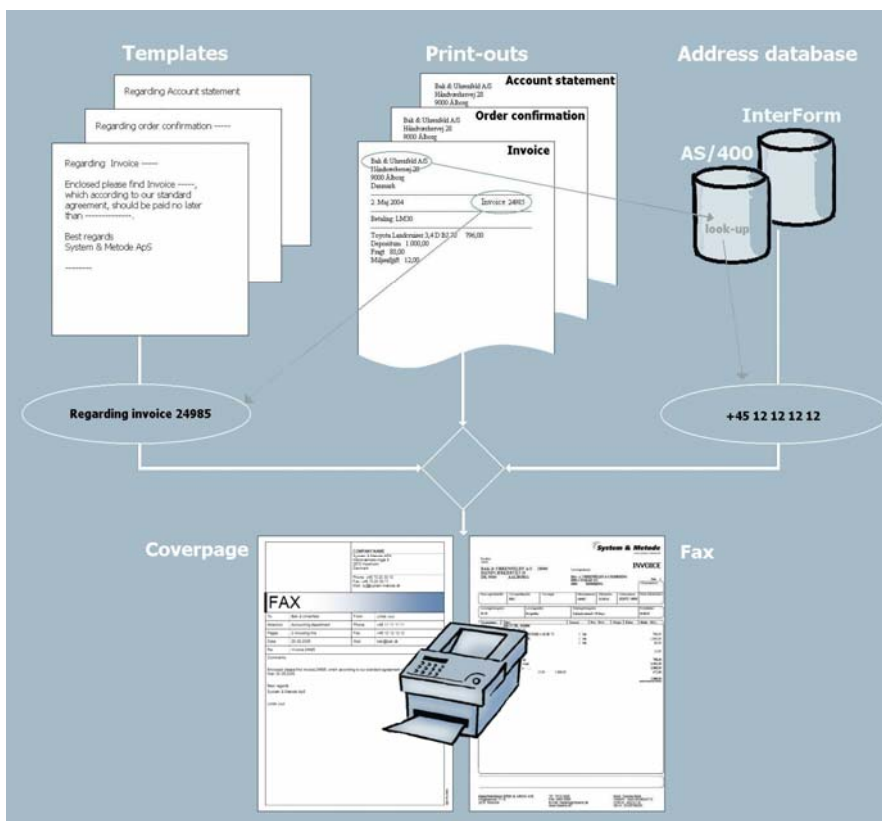

Integration to other applications

All functions can be integrated into existing applications using simple commands or through a number of "User Exits" from within InterForm. The fax can be supplemented with missing data through look-ups in a database or through a call to another program.

Fax any InterForm document

When sending a fax via InterFax it is the actual content of the PCL spooled file that ensures that the fax is automatically send to the right recipient.

The fax image equals you InterForm document and with InterFax installed, it is possible to fax invoices, statements, purchase orders and all other documents which are normally printed via InterForm, directly from your application programs.

InterFax makes it easy to send and receive fax directly from your IBM iSeries or AS/400 – and from all systems under Windows

Automatically send faxes with individual messages

In InterForm it is possible to define which recipients that want their print on fax instead of on paper.

The definition can be created per print type, which makes it possible for the recipient to specify that they want some type (e.g. account statements) on fax and other (e.g. invoices) on paper. The fax number of the recipient is registered directly on the definition or is collected from the database via a customised program (User Exit)

Text templates within the definition make it possible to create standard heading and text for the fax cover page. This can be a combination of firm text and information from the print-out. The templates can also be conditioned by information on the recipient which makes it possible to individualise and language control the fax.

Design your own cover pages

Cover pages can be created directly in the graphic designer, which includes full support for graphic elements in TIFF and colour BMP – and text elements with individual TrueType fonts.

It is possible to create and work with attached sub-forms directly from the form. The designer can structure the way the form is build e.g. by handling the item lines in an attached sub-form, which gives a better overview.

With a drag and drop function, the data is reformatted into the final form. The well known Windows-functions like copying, moving, deleting and selecting more than one element are also supported.

All elements, which are used in the form can be conditioned, which means that the form changes dynamically depending on the contents of the print-out.

Integration

The InterFax module gives the InterForm users access to:

- One fax line for in- and outgoing fax transmission.
- 5250 log handling
- One concurrent Windows PC client for log handling, graphical viewing and faxing of PC based documents.

The InterFax400 module can be upgraded to handle more features like incoming facsimiles, IP-faxing and more concurrent PC users faxing from their workstation. Please contact your InterForm reseller for more information about these features.

Requirements

- OS/400 version 5.1 or newer
- InterForm version 2004 or newer

The InterForm product line ...

InterForm is a complete solution for creating electronic forms on IBM AS/400 and iSeries:

InterForm Security & Digital Signature
Encryption, password-protection and digital signing of PDF-documents on a high level.

InterForm PDF Print
Printing PDF-documents directly from the AS/400.

InterWord
Letter merge and text editing directly on the AS/400.

InterArchive
An archiving system that archives spool files in PDF format.
