

BlueNote Monitor...

... easy monitoring via SMS

*BlueNote Monitor a way
to remotely supervise
your IBM i™*

**BlueNote SMS Monitor can
monitor everything that happens
on your IBM i™(AS/400).**

The OS400 messaging queues are the key factor in BlueNote Monitor. OS/400 reports everything that is going on the IBM i – this adds up to thousands of messages, which makes it an art to filter and pickup just the right messages.

Also as e-mail

It also is possible to receive system messages as e-mail.

OS400 System messages can be replied with a SMS

Any OS400 system message that requires an answer can be replied to via a SMS. All SMS communication can be handled on an ordinary mobile phone.

Send command entry as SMS

This way SMS can be used when starting/executing jobs, restarting subsystems or even when doing an IPL on the AS/400 or iSeries.

Windows Monitor

Further to monitoring the AS/400 or iSeries, activity on 3rd party Windows servers and workstations can be monitored as well.

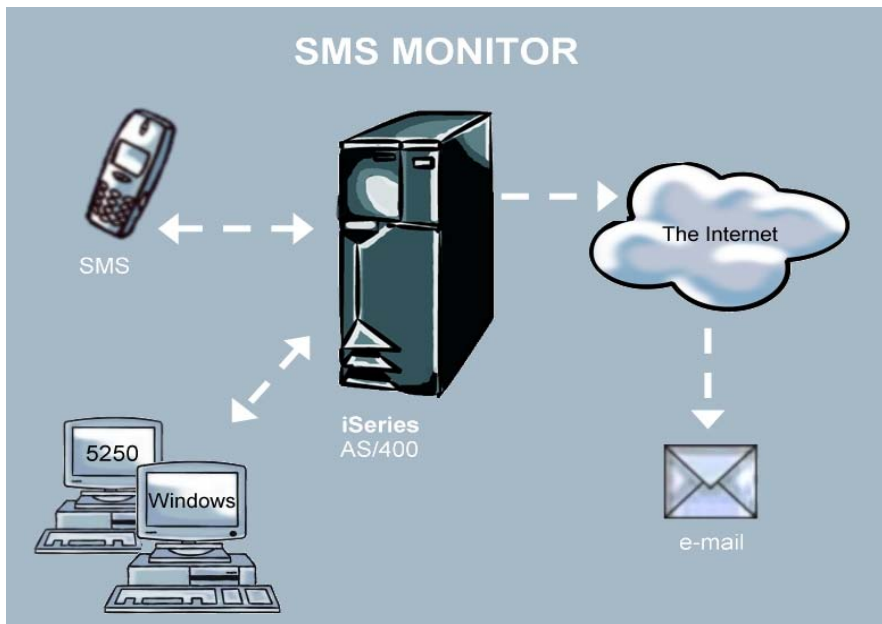

All information in the event log on the server/workstation in question will be transferred to BlueNote Monitor on the IBM i. A filter is defined and the messages are relayed as SMS to the GSM phone.

After hours monitoring

A duty roster plan can be set up to rotate shifts between personnel in the IT-department.

Messages will in the duty period be forwarded as SMS, email or Break MSG all depending on the user profile.

It is possible to have different persons monitoring different areas of interest simultaneously. A fallback chain can ensure that no OS400 messages are pending as "unanswered".

Work with message queue handling.

It is possible to specify any message queue for monitoring. QSYSOPR is the default queue, but that can be ANY message queue, and of course it is possible to monitor more than one message queue at a time.

It is possible to describe in detail how the messages in the monitored message queues are to be handled. The "Message Severity Override" command enables monitoring of any Job, User Profile, Job queue or Subsystem. An API set will enable that e.g. a "Backup OK" or "job 4711 OK" message is sent.

Further it is possible to monitor the hardware on the iSeries as any hardware message will be registered in OS400 and consequently in SMS monitor.

A "scan option" makes it possible to differentiate on similar messages. You might want to know about errors on a particular system printer, whereas printer messages in general are omitted.

The BlueNote product line ...

BlueNote SMS Communicator

With SMS Communicator it is possible to send and receive SMS via the IBM i™ AS/400.

It is easy to integrate SMS Communicator to other applications.

BlueNote Monitor

BlueSeries Monitor will monitor every movement and process on your IBM i™.

You can monitor system messages, message queues, message files, job, user profiles and you can also make a conditioned monitor session

Free 30 day trial period !
